

Issues with installing PYME and supporting packages

Fous on pip based fresh installs

Below we list issues encountered with fresh pip installs and potential workarounds (when available).

Error associated with loading saved npcfit pickle

After a new full install via pip got the following error when trying to open a previously saved (pickled) NPC fit install:

[illegible]

The clue is the reference to `scipy/sparse/linalg/_interface.py` in the error message which led us to check installed scipy versions.

This was accordingly traced to a newer `scipy` install with the “fresh” install which broke object compatibility (presumably due to changes in the object structure related to some linear algebra stuff that was saved as part of the pickling). The older `scipy` installs were v 1.17.X, e.g.

```
conda list scipy
# packages in environment at /Users/csoe002/miniconda3/envs/test-
pyme-3.12-conda_p:
#
# Name                               Version           Build
Channel
scipy                                1.17.1            py312h0f234b1_0
conda-forge
```

whereas the new pip install had 1.18.X:

```
pip show scipy
Name: scipy
Version: 1.18.0
Summary: Fundamental algorithms for scientific computing in
Python
Home-page: https://scipy.org/
Author:
Author-email:
License:...
```

This was fixed with

```
pip install 'scipy==1.17.1'
```

NOTE: the objects in the npcfits pickle are not guaranteed to work across different installations!
